Classification with linear SVM

Chris Bentz

14/10/2023

Description

Support vector machine (SVM) analyses of the feature vectors per character string (loaded from NaLaFi/results/features.csv). The results are stored in NaLaFi/results/SVM. Note that the number of characters has to be chosen manually (via num.char = "''). Note that the kernel (linear, polynomial, radial, sigmoid) has to be chosen manually below.

Load Packages

If the libraries are not installed yet, you need to install them using, for example, the command: install.packages("ggplot2"). For the Hrate package this is different, since it comes from github. The devtools library needs to be installed, and then the install github() function is used.

```
library(dplyr)
library(e1071)
library(class)
library(gmodels)
library(ggpubr)
library(caret)
```

Load Data

Load data table with values per text file.

```
# load estimations from stringBase corpus
estimations.df <- read.csv("~/Github/NaLaFi/results/features.csv")
#head(features.csv)</pre>
```

Exclude subcorpora (if needed).

```
#selected <- c("shuffled", "random") #estimations.df <- estimations.df[!(estimations.df$subcorpus %in% selected), ]
```

Split into separate files by length of chunks in characters.

```
# choose number of characters
num.char = 1000
# subset data frame
estimations.df <- estimations.df[estimations.df$num.char == num.char, ]</pre>
```

Select relevant columns of the data frame, i.e. the measures to be included in classification and the "corpus" or "subcorpus" column.

```
Remove NAs (whole row)
```

```
estimations.subset <- na.omit(estimations.subset)</pre>
```

Center and scale the data

```
estimations.scaled <- cbind(estimations.subset[1], scale(estimations.subset[2:ncol(estimations.subset)]
```

Create Training and Test Sets

```
# Generating seed
set.seed(1234)
# Randomly generating our training and test samples with a respective ratio of 2/3 and 1/3
datasample <- sample(2, nrow(estimations.scaled), replace = TRUE, prob = c(0.67, 0.33))
# Generate training set
train <- estimations.scaled[datasample == 1, 1:ncol(estimations.scaled)]
# Generate test set
test <- estimations.scaled[datasample == 2, 1:ncol(estimations.scaled)]</pre>
```

Building SVM

The following code to build a linear SVM is adopted from https://rpubs.com/cliex159/865583 (last accessed 17.01.2023).

```
## [1] "call"
                           "type"

Visualization

Build scatter plot of training dataset.

Unigram entropy and TTR

```
kernel = "linear",
                scale = FALSE)
w <- t(svm.model$coefs) %*% svm.model$SV
# calculate slope and intercept of decision boundary from weight vector and sum model
slope_1 \leftarrow -w[1]/w[2]
intercept_1 <- svm.model$rho/w[2]</pre>
#add decision boundary
plot.decision <- huni.ttr.plot + geom_abline(slope = slope_1, intercept = intercept_1)</pre>
#add margin boundaries
plot.margins <- plot.decision +</pre>
geom_abline(slope = slope_1, intercept = intercept_1 - 1/w[2], linetype = "dashed")+
geom_abline(slope = slope_1, intercept = intercept_1 + 1/w[2], linetype = "dashed")
# add suport vectors
layered.huni.ttr.plot <-</pre>
    plot.margins + geom_point(data = train.ds[svm.model$index, ], aes(x = huni.chars, y = ttr.chars), c
# show plot
#layered.huni.ttr.plot
```

Entropy rate and repetition rate

```
# downsample the training dataset (otherwise there is a lot of overplotting)
train.ds <- sample_n(train, 100)</pre>
# create applot
hrate.rm.plot \leftarrow ggplot(data = train.ds, aes(x = hrate.chars, y = rm.chars, color = corpus)) +
    geom_point() +
    labs(x = "Entropy rate for 100 characters", y = "Repetition rate for 100 characters") +
    theme(legend.position = "none")
#hrate.rm.plot
# sum classification (with just entropy rate and repetition rate)
svm.model <- svm(as.factor(corpus) ~ hrate.chars + rm.chars,</pre>
                data = train.ds,
                type = "C-classification",
                kernel = "linear",
                scale = FALSE)
w <- t(svm.model$coefs) %*% svm.model$SV
# calculate slope and intercept of decision boundary from weight vector and sum model
slope_1 \leftarrow -w[1]/w[2]
intercept_1 <- svm.model$rho/w[2]</pre>
#add decision boundary
plot.decision <- hrate.rm.plot + geom_abline(slope = slope_1, intercept = intercept_1)</pre>
#add margin boundaries
plot.margins <- plot.decision +</pre>
```

```
geom_abline(slope = slope_1, intercept = intercept_1 - 1/w[2], linetype = "dashed")+
geom_abline(slope = slope_1, intercept = intercept_1 + 1/w[2], linetype = "dashed")

# add suport vectors
layered.hrate.rm.plot <-
    plot.margins + geom_point(data = train.ds[svm.model$index,], aes(x = hrate.chars, y = rm.chars), c

# show plot
#layered.hrate.rm.plot</pre>
```

Combined Plots

```
plots.combined <- ggarrange(layered.huni.ttr.plot, layered.hrate.rm.plot, labels = c("a)", "b)"), ncol = 2, widths = c(1.3, 1))
